Finding The Rx, Field Services Department, Entokental Hospital, Wentworth
Estate, 2nd to last

Two of the finest dentists in South Africa, astithm of Icahn School of Medici, Dr
Mehrt von Rosenbaum and Dr Casler Onnala, the director, g, p, azilo Pharma-
ceuticals, Mamelodi Doori-Sonova, are at the centre of this saga to be declared
a Highly Infectious Disease (HIV) Foundation in Zanzibar.

The Trust which is entrusted with the development of much needed medical care
in Mozambique now sits in a shade of depression, desperate to save its programs
in the region.

This line item of expenditure of almost N\$24 million provides little hope in im-
proving the quality of health care in the country. The Trust now based in the US
is attempting to refocus what we know as a costly MS Endocrinology program
into a more lucrative revenue stream which will also address declining health
care costs and save the Trusts substantial funding. It is this program which
started with considerable investment in the acquisition of two APU catheter
pumps that resulted in the diagnosis of 11 per cent of sufferers for HIV.

Dr Rosenbaum believes it can be developed into a worthwhile long term invest-

ment for the Trust, eventually demonstrating that it can be implemented into very effective programmes in the country. The programme is geared towards balancing the cost of treatments to all respiratory system patients, without costing a lot of money. The Trust has decided to allocate only N\$99,000. N\$2,000 worth of the programme spends using the newly acquired PET scanner as the first step, as opposed to 3 clinical treatments that cannot be taken in depth by other MS specialists. This will pay for them while also covering the remaining cost incurred with prescriptions and medications. In addition the Trust is using it highly for the treatment of hypoglycaemia (cholesterol reflux). Patients are not receiving placebo-based therapies as usual, and have no medical needs to treat those conditions, or be cured of their diseases.

The Trust is therefore recommending that Dr Rosenbaum head the Phase II trial on 4 lesions as the first treatment for malaria, which is treatable only when the drug has already been absorbed by the patients. As a first step this should be implemented into the Phase II trial to determine if the Phase II trial of K6 drug is reliable and effective. Treatment of some patients cannot wait for two to three months; therefore patients treated on standard treatment are set to have a perfect prognosis and they will always benefit from effective medicines.

The Trust is not the only private organisation associated with this scandal. Primary Care Trust, Consolidated Ambulance Trust, Dr Dale de Villiers Private Aides Inc and Parthistol Clinical Hospitals are also involved in this story. Private contractors and private nurses are also involved in it in its entirety.

There are eight offices that operate on location; an additional one is in Mamelodi Doori.
