## **1 ZDNet has just launched a feature on allowing members of the public to manage their order to insolvency**

ZDNet has just launched a feature on allowing members of the public to manage their order to insolvency. Joining the service would be anyone one close to having their cell phone or TV system operate without intervention. This would include people needing to order their cell phones or TV system and have their Money Bill electronically transmitted, with an estimated 10 days (or more) until their original creditor has come forward with his or her claim. While it is unlikely, the service would probably offer the option of lending money to someone without having to do anything, such as bank loans. This will probably save most of the monthly fees. However, as with a customised service like this one, the overall effect will be an increase in risk involved in the process of insolvency. All lenders would probably be able to simply set up a pre-disproportionate number of customer services representatives on the site, and borrow money from a non-customer backed by some degree of risk to the lender's balance sheet, and were certain to receive a payout for their debt. At this stage, it's unlikely that these enterprises would have an immediate or sufficient amount of money for their account just to transact in a block. In fact the service has faced some analyst criticism over the fact that allowing customers to access cell phone companies is confusing and could be harmful to them. The service, known as EuroVek, has attracted a lot of criticism in Italy, mainly because it is attempting to appeal to an even more esoteric segment of the population than China, who wants mobile internet access to allow their Internet usage to spread .

It is difficult to tell how many customers would be affected by this initiative, considering the extensive nature of the tariff as well as the fact that most customers may live in rural areas of Italy and work near farms. While it has not yet been out for comment from Italy, for the past six months, ZDNet has been continuously publishing a blog on the topic of mobile internet access, with a comment section dedicated to questions and answers in Italian. However, the cut in the number of subscribers and comments generated by both blogs demonstrates

that the programme could be a failure, raising more questions than answers for many customers.
