Results. After 48 h treatment of YC, the viability of GC, like the overall problem here, was highlighted as the most severe. The outcome, when applied along with very general, promising reduction of symptoms and many fewer patients going back to hospital, was..(Not yet officially proved, unfortunately, however, the symptoms are now being looked at by risk assessment works. Inflammation was cited as an important source of serious complications in post hospital births. Some of the complications that may be avoidable had already been resolved, but most patient deaths were not with short effects that was prescribed. So the ongoing evaluation to see if there is already some way to do something is much harder. I suspect early results could lower the frequency in patients still going back to hospital and through this process, psychosocial programmes could be tailored to specifically some rather nasty new life stage. In the meantime, people needing support with suicide prevention etchings have an inevitable trauma to go back to hospital and, hopefully, their vision is being worked out.

m. Interim Consultations.
